This protein comprises an immunoglobulin (Ig) C-gamma-4 region.

The invention provides a method for the production of tumour-
specific Ig derived from a B-cell lymphoma patient. In the novel
method, expression plasmids containing the patient's VH region(8)
joined to either a C-gamma-3 (see AAT97188) or C-gamma-4 (see AAT97189)
cequence and expression plasmids containing the patient's VL
region(8) joined to either a C-kappa (see AAT97190) or C-lambda-2
(see AAT97191) sequence are cotransfected along with a selectable and
amplifiable marker into a cell line (e.g. BW5147.61.4), and
camplifiable marker into a cell line (e.g. BW5147.61.4), and
transfected cells are then subjected to selection and amplification.
The method permits the production of a multivalent vaccine which
reflects the degree of sometic variation found within the patient's
tumour. These novel multivalent vaccines provide superior vaccines
for the treatment of B-cell lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GLYSLSSVVIVPSSSLGTXTYTCNVDHKPSNTKVDKRVESKYGPPCPSCPAPEFLGGPSV 120

The invention relates to an immunoadhesin comprising:

(a) a chimeric intercellular adhesion molecule (ICAM)-1 comprising a chinovirus receptor protein linked to at least a portion of an immunoglobulin heavy chain, and

(b) optionally a J chain and secretory component associated with the chimeric ICAM-1 molecule. The immunoadhesin has plant-specific glycosylation and virucide activity. The immunoadhesin is useful for reducing infection by human rhinovirus (HRV) and hence the initiation or spread of the common cold by HRV. The immunoadhesin hinds to HRV and reduces its infectivity, competing with cell surface ICAM-1 for binding sites, interfering with virus entry or uncoating and directing premature of viral RNA and formation of empty capside. Expression of the immunoadhesin having multiple binding sites have a higher effective immunoadhesin having multiple binding sites have a higher effective of fining the virus, thereby increasing the effectiveness of the immunoadhesin association of secretory component and immunoadhelin J chain increases the stability of the immunoadhesin in the mucosal chain increases the stability of the immunoadhesin in the mucosal chain increases the stability of the immunoadhesin in the mucosal chain increases the stability of the immunoadhesin in the mucosal chain increases the stability of the immunoadhesin in the plants than in animal cell culture and production in plants is safer for human use, since plants are not known to harbor any animal viruses. The present sequence is that of a human immunoglobulin protein sequence, useful to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          181 RVVSVLTVLHQDWLNGKEYKCKVSNKGLPSSIEKTISKAKGQPREPQVYTLPPSQEEMTK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for reducing the immunogenicity of a fusion protein which involves identifying a candidate T-cell epitope within a junction spanning a fusion junction of a fusion protein, and changing an amino acid within the junction region to reduce the ability of the candidate T-cell epitope to interact with a T-cell receptor. The method is useful for reducing the immunogenicity of a fusion protein. It is useful for analysing, changing or modifying one or more amino acids in the junction region of a fusion protein to identify a T-cell epitope and reduce its ability to interact with a T-cell receptor. The epitope and reduce its ability to interact with a T-cell receptor. The less immunogenic fusion proteins are useful in providing therapeutic treatment. The present sequence is human immunoglobulin G4 (1964) heavy chain Fc region used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RVVSVLTVLHQDWLNGKEYKCKVSNKGLPSSIEKTISKAKGQPREPQVYTLPPSQEEMTK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              181 RVVSVLTVLHQDWLNGKBYKCKVSNKGLPSSIBKTISKAKGQPREPQVYTLPPSQEBMTK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents the amino acid sequence of C-gamma-4. The protein is used in the course of the invention. The specification describes cytokine antagonists comprising only the extracellular domain of the specificity-determining component of the cytokine receptor. The cytokine receptor and the extracellular domain of a signal-transducing component of the cytokine receptor. The cytokine is an interleukin (IL-1, IL-2, IL-3, IL-4, IL-5 or IL-15), gamma-interferon or transforming growth factor (GM-CSF), gamma-interferon or transforming growth factor-beta (TGF-beta). The complex. The compounds have therapeutic activity as gytokine antagonists and can also be used in assays for identifying novel agonists and antagonists of cytokines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 329;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention concerns production of antagonists to any cytokine that utilizes an alpha specificity determining component, which when combined which the cytokine, binds to a first beta signal transducing component to form a non-functional intermediate which then binds to a second beta signal transducing component causing beta-receptor dimerization, the soluble alpha specificity determining component of the receptor (SR-alpha) and the extracellular domain of the first beta signal transducing component of the cytokine receptor (beta-1) are combined to them heterodimers (sR-alpha:beta-1) that act as antagonist to the cytokine by binding the cytokine to form a non-functional complex. The receptor components are shared by cytokines such as the CNTF (ciliary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acid molecule for treating cytokine-related diseases or disorders encodes a fusion polypeptide capable of binding a cytokine to form a nonfunctional complex

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 62
neurotrophic factor) family of cytokines. The invention provides the basis for the development of IL-6 antagonists, as they show that if, in the presence of a ligand, is anon-functional intermediate complex, consisting of the ligand, its alpha receptr and its beta-I receptor component, can be formed, it will effectively block the action of the ligand. Effective antagonists of IL-6 or CWTF consist of heterodimers of the extracellular domains of the alpha specificity determining components of their receptors and the extracellular domain of gpl30. The resultant heterodimers, function as high-affinity traps, rendering the cytokine inaccessbile to form a slighal transducing complex with the native membrane-bound forms of their receptor. The nucleic acids and picypeptides are useful for treating cytokine-related diseases or disorders such as osceoporosis and primary and secondary effects of cancer including multiple myeloma or cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3 ASTKGPSVFPLAPCSRSTSESTAALGCLVKDYFPEPVTVSWNSGALTSGVHTFPAVLQSS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           62
                                                                                                                                                                                                       Humanised anti-L-selectin antibody Hubreg 55 comprises 2 heavy chains each having the sequence given in AAM13564 and 2 light chains each having the sequence given in AAM13563. These are encoded by the cDNA clones given in AAT61280. Hubreg 55 can be used to prevent multiple organ failure associated with polytrauma and for the prevention of acute organ damage associated with extracorporeal blood circulation. The antibody inhibits interaction between the carbohydrate-recognising domain of the selectin and the corresponding cell surface receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   - a
                                                                                                                                                                                                                                                                            The present sequence represents the constant region of human IgG isotype 4 (IgG4, C-gamma-4). C-gamma-1 (see AAY31669) and C-gamma-3 (see AAY31671) bind For receptors with high affility, whereas C-gamma-4 has 10-fold lower binding affinity and C-gamma-2 (see AAY31670) does not bind to For receptor gamma-1. The invention provides methods for the genetic construction and expression of antibody-based fusion proteins with enhanced circulating half-lives. The fusion proteins with enhanced circulating half-lives. The fusion proteins with enhanced circulating half-lives. The receptors, either as a consequence of the antibody isotype used for corresponding to the gamma-1.

To gamma-4 For receptor, or through directed mutagenesis of antibody isotypes that normally bind For receptors, i.e. C-gamma-1.

Or C-gamma-3. The methods can be used for to increase the circulating half-life of a non-immunoglobulin (Ig) protein such as a cytokine, e.g. tumour necrosis factor (IMFP), an interleukin or a lymphotoxin or a colony stimulating factor, a ligand-binding protein, e.g. CD4, CTLA-4, TNF receptor or an interleukin receptor, or a protein toxin (claimed). The fusion protein ser used to deliver selectively the second non-Ig protein can expect cell in vivo so that the second non-Ig protein can exert a localised biological effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               182

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              correspond to murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody 2A2 (see also AAN14931-32). The are encoded by a 2A2 human 1954 expression plasmid insert (see also AAT62933). A chimeric antibody specific for porcine VCAM can k produced in transfected host cells. It is useful for diagnosing human rejection of porcine xenotransplants and for improving xenotransplantation of porcine cells, tissues and organs into human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human cell interaction
for rejection of xenografted

Heavy chain (AAW14932) and light chain (AAW14931) sequences are provided for the murine anti-porcine soluble vascular cell adhesion molecule (VCAW) monoclonal antibody (MAD) 2A2. Hybridoma 2A2 was produced by standard techniques using recombinant, soluble porcine VCAW as immunogen. Chimeric antibodies can be produced by cloning vCAW as immunogen. Chimeric antibodies can be produced by cloning expression plasmid pAPEX.3P modified to contain the human gamma4 constant region in place of the human gamma1 C1 region. Sequences are provided for 2A2 chimeric) human G2/G4 cDNA (AAW14933), and 2A2 human G2/G4 expression plasmid insert product (AAW14935.36). The chimen ingG4 expression plasmid insert products (AAW14935.36). The chimen cantibodies are specific for porcine VCAM. They are useful for diagnosing human rejection of porcine vcancransplants and for improving xenotransplantation of porcine cells, tissues and organs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antibodies binding to porcine but not human cell interaction proteins - useful to treat and assay for rejection of xenografted porcine organs, tissues or cells
                                                                                                                                                                                                                            splantation, graft rejection, cell interaction, pig,
cell adhesion molecule; VCAM; monoclonal antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mueller JP, Rollins S;

Heavy chain (AAW14938) and light chain (AAW14937) sequences are provided for the murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody (WAAD) 3F4. Hybridoma 3F4 was produced by standard techniques using recombinant, soluble porcine VCAM as immunogen. Chimeric antibodies can be produced by cloning constant region in place of the human gammal craspion in place of the human gammal Cl region. Sequences are provided for 3F4 (Chimeric) human G2/64 contain the human gammal cl region in place of the human gammal Cl region. Sequences care provided for 3F4 (Chimeric) human G2/64 contain the standard insert product (AAW14949), and 3F4 human IGG4 expression plasmid insert products (AAW14940), and 3F4 chuman insert antibodies are specific for porcine VCAM. They are useful for diagnosing human rejection of porcine xenotransplants and for improving xenotransplants and organs into human recipients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GLYSLSSVVTVPSSSLGTKTYTCNVDHKPSNTKVDKRVESKYGPPCPSCPAPEFLGGPSV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3 Polypeptides (AAW14925-27) respectively comprise the heavy chain regions of human gamma-4, gamma-4E carrying an L236E mutation in the hinge region, and gamma-4PE carrying L236E and 8229P mutations. They can be incorporated into novel monoclonal and chimeric antibodies, e.g. CE9 gamma-4, CE9 gamma-4FE and CE9 gamma-4PE, in which the human Ig46 FC binding domain framework is combined with the antigen binding domains framework is combined with human CD4 monoclonal antibody E9:1. These antibodies show high affinity to human CD4, have little or no immunogenitity in humans and show reduced or absence of effector function. They can be used to treat autoimmune diseases such as rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .
                            CD4; monoclonal antibody; chimaeric antibody; recombinant an cynomolgus monkey; autofimmune disease; rheumatolid arthritis; leukaemia; lymphoma; graft-versus-host disease; asthma; transplant rejection; HIV; therapy; CE9 gamma 4.
                                                                                                                                                                                                                                                                                                                                                                              Chimeric antibody comprising monkey variable domains and hum constant domains - affects CD4-mediated immune functions, euseful for treatment of autoimmune disease, e.g. rheumatoid

                                                                                                                                                                                                                                                                                                                                                                                                              AAR80617 is the anti-human IL-4 humanised monoclonal antibody (MAE) AB5D2-9, mature heavy chain. It can be used for the prepp., purifcn. and immunosesay of the humanised Abs. Pharmaceutical compsns. and anti-idiotypic Abs (against the MAD) can also be prepd. for the treatment of IL-4 related diseases by respectively suppressing, or imitating the binding activity of IL-4. The humanised MAD is derived from the rodent. MAD 25D2.
                                                                                                                                                                                                                                                                                                                Humanised monoclonal antibody against human interleukin (IL)-4 has increased binding affinity and expression, and hence greater therapeutic value in the treatment of IL-4 related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence is encoded by the insert of the vector pMDR1002. Three fragments were used in the construction of pMDR1002; a 443 bp Not1/
Hindili fragment of pMDR1001 (see AAG30905); he 7913 bp Not1 linearised pSAB122 (see AAG30906) and a 2109 bp Not1/Hindili fragment of pBAG101 (see AAG30909). These fragments were ligated together and the ligation mixture was used to transform B. coli JA221(fg) to ampicillin esistance. This sequence represents the immunoglobulin signal sequence, amino acids (AA) 1-122 of the humanised SAB heavy chain, variable region (HV) and AA114-AA478 of the humanised SAB heavy chain, i. the constant region (HC). This polypeptide is an antibody homolog which was shown to bind to CD4 but did not block the binding of gp120 to CD4. CD4 is a cell surface glycoprotein of CD4+ lymphocytes (helper/inducer cells). The homolog blocked HIV-induced syncytia formation. This homolog can be used in the detection, prophylaxis and treatment of diseases caused by infective agents whose primary

                                                                                                                                                                                                                                                             Sequence 10, Application US/08523894

Sequence 10, Application US/08523894

Patent No. 6136310

GENERAL INFORMATION:
APPLICANT: Hanna, Nabil
APPLICANT: Newman, Roland A.
APPLICANT: Newman, Roland A.
APPLICANT: Reff, Mitchell E.
TITLE OF INVENTION: Recombinant Anti-CD4 Antibodies for Human TITLE OF INVENTION: Recombinant Anti-CD4 Antibodies for Human TITLE OF INVENTION: Recombinant Anti-CD4 Antibodies for Human TITLE OF INVENTION: Recombinant Anti-CD4 Antibodies for Human TITLE OF INVENTION: STREES.

CONDESSEE: BURNES.
